

Active, Adaptive, Invisible

OVERVIEW

Trinity Cyber's *Proactive Threat Interference*® (PTI) service operates outside of a corporate network, disrupting cyber adversaries' efforts before they reach their target. While most companies employ cybersecurity tools such as firewalls and endpoint security solutions, these solutions are internally focused and predominantly reactive. Trinity Cyber operates in the Internet, between the adversary and our clients, to eliminate threats, complementing our clients' existing internal network security operations. Trinity Cyber's unique, adversary interference technology has been used to defend against the world's most sophisticated cyber threats.

Stopping the adversary no matter the protocol or target—traditional endpoints, routers, servers, IoT, ICS...

FOCUSED ON THE ADVERSARY

While our clients focus internally on network security and incident response, Trinity Cyber's service identifies adversary activity from outside our clients' networks and proactively intercedes on their behalf, with little or no work required from them. Because our methods are invisible, the adversary often mistakes failure for success... Or they realize the failure, but can't determine why. This is what makes Trinity Cyber's PTI uniquely effective.

Active

Trinity Cyber proactively identifies and neutralizes malicious activity before it threatens a client's network

Adaptive

Trinity mimics the adversary's tactics and protocols, while perpetually uncovering their new techniques

Invisible

Trinity's methods and tactics do not alert the adversary that their efforts are being detected or impeded

IN THE INTERNET

Trinity Cyber operates in the Internet, as opposed to within individual networks. By doing so, Trinity Cyber is able to evaluate our clients' Internet traffic before it becomes their network traffic. Leveraging our unique vantage point in the fabric of the Internet, Trinity Cyber operates with an unparalleled view of the cyber threat landscape. Because of this, we can observe and disrupt cyber adversaries' operations regardless of how our clients' internal networks are configured.

INDEPENDENT & COMPLEMENTARY TECHNOLOGY-ENABLED OPERATIONS

Trinity Cyber is independent from and complementary to our clients' existing network security. In a time when a cyber adversary goes undetected for an average of 191 days, no organization should rely solely on internal network security solutions or kill chain mitigation.
